

# ECK<sup>®</sup> Electrolysis Corrosion Kontrol

A single application of ECK is all that is needed to keep your truck trailer bodies and parts protected for life.

By creating a barrier coating between like or dissimilar metals, patented ECK virtually eliminates rust and corrosion caused by oxidation and electrolytic and galvanic transfer.

You need only ECK no matter what combination of metals—aluminum, stainless steel or galvanized steel. ECK contains zinc which acts as a sacrificial element, dispelling the electrical charge created when metals come into contact with electrolytes such as water, dirt or oil.

ECK surpasses traditional attempts at corrosion prevention such as waxes, double sided tapes, caulks and coated fixtures because ECK is more effective, less expensive and much faster and easier to apply. Simply spray it or brush it on during assembly. It's that easy.

Safe for electrical connectors and painted surfaces. The world's largest paint manufacturers—PPG, Du Pont, Akzo, BASF and Seymour paint—certify that ECK will not harm paint.
